Incident Report INC-1042 - Summary

Incident INC-1042: nightly_batch_07 failed at 02:10 and the morning sales report was delayed by about 50 minutes. Severity was medium.

Affected service: nightly sales reporting. Business impact: regional managers received the morning sales report at 07:50 instead of 07:00.

Detected by: automated job monitor alert at 02:11.

Root Cause Analysis

Root cause: the upstream feed was delivered at 02:55, after nightly_batch_07 had already started at 02:10. The job failed with return code 12 because its input file was missing.

The scheduler has no file-arrival dependency for this job, so it started on the clock even though the feed had not landed.

The documents received do not explain why the upstream feed was late.

Resolution and Follow-up Actions

The rerun was approved at 03:05 by the shift lead. Follow-ups: ask the data team why the feed was late, and review the SLA alert threshold.

Proposed improvement: add a file-watcher dependency so nightly_batch_07 waits for the feed instead of starting at a fixed time.

Status: resolved. Incident closed after review.
